

# Gerrit with Jujutsu

Jujutsu has a very similar model to Gerrit! How nice it would be to integrate them!

Unfortunately, Jujutsu currently [doesn't support Gerrit natively](#). You'll have to rely on a couple of workarounds to get it working.

1. You need to [colocate with Git](#), because Jujutsu doesn't quite understand Gerrit's push semantics.
2. You need to add Change-Id footer that is required by Gerrit. Jujutsu doesn't support git hooks; you may use regular Git to amend the commit message to have this footer.

Cleaner solution is to teach Jujutsu to do this: see [this](#) (untested) example on how to teach Jujutsu to append Change-Id footer.

3. You need to `git push` using regular git command.

See [this issue](#) for tracking progress.
